Abstract

In the field of nanotechnology Green synthesis of nanoparticles has received increasing attention because of its eco-friendliness, cost effective nature, safety and simplicity. The present study focuses on the production of herbal nanopowders from *Rauwolfia serpentina*, an important medicinal plant of Apocynaceae, employing ball milling technique which produces homogeneous nanoparticles. These nanoparticles were then thoroughly characterized using UV-Visible spectroscopy, Scanning Electron Microscopy, X-Ray Diffraction, FTIR confirmed the presence of various functional groups in the herbal nanopowders. Then the bio-active constituents in root, stem and leaf nanopowders were evaluated using GC-MS. Different types of compounds were identified in root, stem and leaf nanopowders by comparison of GC-MS spectrum with Library searches. The Anti bacterial and anti fungal activity of methanolic root, stem and leaf nano powder extracts are tested against selected bacteria (*Klebsiella pneumoniae*, *Salmonella typhi*, *Vibrio cholerae*, *Corynebacterium diptheriae*, *Vibrio parahaemolyticus*) and selected fungi (*Aspergillus fumigatus*, *Candida albicans*, *Mucor hiemalis*). The methanolic extract of synthesized herbal nanoparticles showed potent antimicrobial activity against all the test bacteria and fungi

when compared to standard drugs.

Key words: *Rauwolfia serpentina*, Ball milling, Herbal nano particles, GC-MS

Introduction

In recent years, green synthesis of nanoparticles has been an active area of research owing to their excellent properties and remarkable applications. Nanoparticles, the fundamental blocks of Nanotechnology possess some novel properties not seen with macro-molecules. At Nano size (1 to 100 nm), atoms and molecules work differently and produce a variety of surprising and interesting results (1). Nanoparticles can be synthesized by physical, chemical and biological approaches. Biological approach for nanoparticle synthesis utilizing plants also called "Green Synthesis" is completely eco-friendly that connects Nanotechnology with plants. Synthesis of metal nanoartides from plants has attracted the attention of researchers in recent years (2). Various types of metal nanoparticles like silver, gold, copper, zinc etc., have been widely used in different fields of science. Silver nanoparticles were widely used in nanomedicine as they have multi functional applications like anti-bacterial, anti-fungal, anti-viral, anti-parasite, anti-inflammatory, anti-angiogenic and anti-cancer properties (3). Although silver nanoparticles are most frequently used nanoparticles because
